

Fork Positioners

A fork positioner is actually a tool constructed out of high quality materials intended to withstand the most difficult operations and work environments. This particular piece of equipment could enable the person driving to operate the forks hydraulically without leaving the seat. Side shifting models have the added ability to be able to laterally position the arms or the entire load in order to facilitate much more exact lifting and position in a quicker and more effective way.

The only one of its kind blade pocket design enables the person operating it to be able to securely sway the unit's forks without any worry of destroying the positioning cylinders. This can allow the operator the choice to either perform simultaneous or independent fork movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be converted into blade positioners on existing units.
